Proceedings of the Hon'ble the Lieutenant-Governor of the Punjab, in the Home (Medical and Sanitary)
Department, No 425 S., dated the 5th of July 1898.

READ-

The Report on the Sanitary Administration of the Province for the year 1897 by Brigade-Surgeon-Lieutenant-Colonel W. A. C. Roe, Sanitary Commissioner of the Punjab.

REMARKS.—The year 1897 was on the whole a healthy one despite the prevalence of scarcity. With the exception of the outbreak of bubonic plague, which is noticed below, no disease of an unusual character prevailed. There was a diminution in the mortality from small-pox. The birth-rate, as noted below, maintained the high figure it has shown during the past few years. In accordance with the recent orders of the Government of India, as contained in its letter No. 379, dated the 24th of February 1298, details relating to towns and thánás have been omitted from Forms Nos. I and II, the totals for the districts only being given. Form No. VI, which formerly supplied information regarding the large Municipal towns only, has, in compliance with instructions from the same authority (Home Department letter No. 15, dated 8th January 1897), been enlarged so as to embrace all the Municipal towns in the Punjab, at present 151 in number. A new statement (No. XI) showing the chief sanitary defects in Municipal towns is also given as requested in the orders of the 24th of February 1898

2. Births and Deaths.—The number of births registered during the year 1897 was less by 10,069 than in the previous year, but the birth-rate amounted to 42.6 per 1,000 of population, which was again the highest birth-rate recorded in any Province in India—a circumstance attributed by the Sanitary Commissioner to the system recently introduced in the Punjab of checking the chaukídárs' memorandum books by the new Divisional Inspectors of Vaccination and by Vaccinators. The districts showing the highest birth-rates vary somewhat from year to year; nevertheless some districts maintain a fairly high standard continuously. The following list shows the order of merit of the best districts in this respect for five years:—

	High th-rates 1893.		1894		1895		1896.		1897.	
ret znd 3rd 4th 5th	kok kot ano ano 'iboa	Gurgaon <i>Karnál</i> Delhi Rohtak Ludhiána	*** *** ***	Gujránmála Amritsar Karnál Gurgaon Siálkot	202 272 204, 402,	Gujránwála Jhang Gurgaon Rohtak Ferozepore	**** ***	Gujránwála Ferozepore Jhang Siálkot Gurgaon	### \$ ### \$ ###	Jhang. Gujránwála. Karnál. Mooltan. Ferozepore.

3. There is a much greater variation in districts showing the highest death-rates:—

High death-rates	1893.	1894.	1895.	1 8 9 6.	1897.
Highest	Amritsar Lahore Gurdaspur Sialkot	Juliandur Amritsar Gurdaspur Umballa	Umballa Delhi Karhal Kangra	Umballa Karnál Kangra Ráwalpindi	Dera Ismail Khan. Hissar. Muzaffargarh. Bannu
Umballa	Ludhiána here takes the	Hoshidrpur Lead as the un	Räwalpindi blealthiest dist	ict generally.	Karifal

- 4. The death-rate in Hissar averaged about 30 for ten years past, but in 1897 it rose to 45. This is doubtless attributable to scarcity, though the Famine Report shows that only two deaths were directly due to starvation, and these doubtfully so. There was considerable mortality among children under 10 and persons of 50 and more. Taking the ratios per 1,000 of population, the figure in the case of children was 24 in Hissar as against 18 in the Province as a whole, in the case of old people 11.5 as against 6. The high birth-rates in Gujránwála and Jhang are probably due to the large immigration owing to the Chenab Can al which has taken place in these districts since the last census.
- 5. The probability of a healthy year being followed by one with a high birth-rate seems to be borne out when the figures for the whole Province are taken—thus 1892 was a very unhealthy year with a death-rate of 49.4. In 1893 the birth-rate fell to 34.9. The death-rate in 1893 was low, 28.13, and in 1894 the birth rate rose to 4.29. These are typical instances. For the past five years there has been no undue unhealthiness. The births as related to preceding death-rates were as follows:—

Deaths.	Births.	11 eaths	Births,	l eaths.	Births	Dearbs.	Births	Deaths	Births.
1892.	1893.	1893.	1894.	1894.	1895.	1895.	189б.	1896.	1897.
49'4	34'9	28.1	43'9	37.0	43 8	29'2	43'04	3:'5	42.6

6. In respect to the matter of the infliction of fines for neglect to register births and deaths it is observed that there is still some variation in the amount of fine inflicted. The Lieutenant-Governor hopes that the effect of his remarks in paragraph 5 of the Review of the Report for 1896 (which were not published till July 12th, 1897) will be seen in the figures of fines for violations of registration bye-laws for the year 1898. It was not to be expected that they would influence the figures for 1897.

7. With reference to the remarks regarding the failure of Tahsíldárs and Naib Tahsíldárs to detect omissions in the registers of village chaukídárs, the Lieutenant-Governor in paragraph 7 of last year's Review observed that it would be interesting to know precisely what is meant by an omission and whether it is everywhere similarly understood. The object is to discover whether supervising officers on finding a single column in the register blank record this as an omission notwithstanding the fact that other particulars of the occurrence are furnished. The attention of the Sanitary Commissioner is drawn to last year's remarks on the subject.

- 8. Chief diseases.—The table in paragraph 30 shows that, with the exception of the increase in fever, the year as above noted was a healthy one. Even fever, which gave an average of 24.2 deaths in the previous ten years, reached only 20.5 in 1897.
- Tahsil of Jullundur, and spread into the Garhshankar Tahsil of Hoshiarpur in the cold weather of 1897, will receive separate consideration on a detailed report which is awaited from the local authorities. It is sufficient to say here that though the source all eged in the Report on the Sanatary Administration as that from which the disease was introduced may be the true one, this is not certain, and it seems quite as probable that the Rawals, who have a home in Khatkar Kalan and who are notorious wanderers, may have brought plague with them from Poona or Bombay. It may be added that the efficacy of the plan which was

adopted of arranging for the evacuation of the site of each village attacked was amply demonstrated, though it varied in degree according to the promptitude with which outbreaks were discovered and the remedial measures applied. The Lieutenant-Governor is not aware of the Sanitary Commissioner's reasons for thinking that two, or possibly three, villages were infected with plague before it was realized that the disease had made its appearance; but the subject will be elsewhere discussed.

- importance was seen. Fortunately it did not spread as might have been expected in a famine area. Apparently its focus was Bhiwani, but there seems nothing to show how Bhiwani became affected.
- experience as to the way in which the disease works in the Punjab. Of the total deaths, 61 per cent. on an average occurred in the last five years among children between 1 and 12 years of age. In 1897 from a total of 6,077 deaths 8,549 were amongst children. The need for efficient vaccination of children seems clear from this state of things.
- 12. Bowel complaints.—The prevalence of bowel ailments in Hissar and in some other districts of the Delhi Division is what was to be expected; they always are associated with famine.
- 13. As regards the general effect on the public health produced by the introduction of drainage and water-work schemes, it may be said that structural improvements under the head "Drainage" may in one place mean sewage schemes, in another only surface drainage, in another removal of water-logging, &c. Without details for each place it would be useless to attempt to draw any conclusions from the figures in this table regarding results from drainage; but taking only places to which good water has been supplied one finds the following results, arranging the figures before and after the supply in neighbouring columns:—

	After wa'er- supply.	Before.	After water- supply.	Before.	After water-	Before.	After	
					supply.		water- supply.	Before.
		,						
Delhi	0.00	0.42	1'22	0.20	21 2 4	25.72	r 6 8	1'94
Umballa	0.13	o*54	1.52	0.38	11.33	19.32	5 *3	6'40
Lahore	0′58	1-87	0.91	1.55	10:81	27.79	1.20	2:26
Dalhousie	***	### [©]	0'30	***	9.58	9 59	1.86	2.43
Rawalpindi	1'10"	0 45	0'44	0.07	22.72	16 37	2.26	3.38
Murree	o'35.	o:68		0.36	18:35	1479	1.72	0.91
Relation	0.46	1 70	0107	0.18	16'64	15 24	2*45	388
Abbott-abad	067	0 63	0.0		10 00	8 92	0'34	0.72
Haripuy.	0.30	4 04	3 30	0 24	14110	17.28	0 70	2.32

From this it would seem that in all the diseases noted except small-pox (which is not a water-borne disease) there has been a diminished death-rate in the majority of instances since good drinking water has been supplied. It is, however, premature to make any positive statement. What is noteworthy is that in Delhi, Umballa and Lahore there has been decided improvement.

The state of the second of the

14. The following statement referred to by the Sanitary Commissioner in paragraph 57 of his Report as showing the death-rates from principal diseases in the town of Pesh awar before and after the completion of a drainage and water-supply did not accompany the Report, but has been received since:—

And the state of t	DAT COMPL O WORK	ETION	AVERAGE ANNUAL DEATH- RATE SINCE THE COM- PLETION OF THE WATER-SUPPLY. 	Drainage	Water-supply.	Cholera,	Small-pox.	Fevers.	Dysente r y a n d diarrhœa.	Cholera.	Small-pox.	Fevers,	Dysentery and diarrhoea.	Cholera,	Small-pox.	Fevers.	Dysentery and diarrhosa.
Peshawar City	1888	1892	0.76	1.89	22:37	1.31	1 40	1.30	22.27	1.65	1,38	4.10	19'26	1.01

From these statistics it will be seen that there has been improvement in the public health except in the matter of "fever," in which there has apparently been an increase.

With reference to the endeavours that have been made to combat the annualy mortality from fever by bringing quinine Paragraph 67. within the reach of the population and especially of those living at places far distant from our dispensaries, by (a) free distribution, (b) postal agency, it may be noted that in the autumn of 1894 His Honor the Leutenant-Governor (Sir Dennis Fitzpatrick) sanctioned as an experimental measure a scheme put forward by the Inspector-General of Civil Hospitals for the sale of quinine through Postal agency to the people of the plains districts of the Delhi Division. The scheme was based on lines that had been reported to be successful in Bengal, i.e., the consumer was to pay Re. 1-9-6 for a packet of 102 powders of five grains each, of which Re. 1-8-0 was to be payable to Government, and I anna 6 pies to be retained by the postal vendor as commission. The experiment failed; the consensus of opinion by those having the best knowledge on the subject being that the scheme had been unduly handicapped by having had to contend, side by side, with a separate scheme under which a free distribution of the drug was made by Government agency, such as Lambardárs, Zaildárs, Vaccinators, &c., &c., and that if it was ever to be a success the gratuitous distribution of quinine should be put a stop to except in the case of patients attending the dispensaries where the dispensing of the drug gratis, or upon payment, should be exactly the same as in the case of other drugs. On the other hand, it was felt that a too rigid adherence to any such rule might prevent the drug reaching the really indigent living at a distance from the dispensaries. Sir Mackworth Young is, however, very unwilling that the experiment of placing quinine within easy reach of the people by sale through Postal agency should be abandoned without further trial, and a new scheme is therefore in course of preparation under which the free distribution outside dispensaries, particularly in the most unhealthy tracts, will not be altogether stopped, but the system be so regulated, and in some cases be perhaps stopped altogether, so as to give sale through the Post Offices a fairer trial. The scheme when matured will be tried again in the plains districts of the Delhi Division and also in the Lahore Division:

- With regard to the matter of encouragement of village sanitation, it may be noted that in the month of December 1807 Paragraph 69. a Circular was issued to the Commissioners and Superintendents of the Cis-Indus Divisions pointing out that the original proposal of the Sanitary Board was not for the reward of individuals with khillats, but for the reward of entire village communities. His Honor expressed an opinion that a scheme of the kind by which the native energy of villages would be called out and all villages would have an inducement to improve their sanitation might produce encouraging results, and he accordingly desired that the experiment should be tried of a District Board offering to pay a considerable fraction of the revenue demand of the one village in each tabsil which showed the best results during the current year (1898), the adjudicators being the Deputy Commissioner and the Civil Surgeon aided by one or two native officials. The Lieutenant-Governor will be glad if the Sanitary Commissioner will bear in mind that a full report of the action taken and its results is to be submitted as early in the year 1899 as possible. The Sanitary Commissioner should arrange for the submission of this report and for brief mention of the subject in his Sanitary Report for this year.
- 17. The thanks of the Lieutenant-Governor are due to Brigade-Surgeon-Lieutenant-Colonel Crawford Roe for this Report and for his work during the year.

ORDER.—Ordered, that a copy of the foregoing Remarks be circulated with the Report and forwarded with the usual number of copies of the Report to the Government of India; also that the Review be published in the *Punjab Government Gazette*.

Ordered also, that a copy be forwarded to the Sanitary Commissioner, Punjab, for information and guidance in regard to the points indicated.

By order of the Hon'ble the Lieutenant-Governor,

H. J. MAYNARD,

Junior Secretary to Government, Punjab.

Section V.—Vital Statistics.

BIRTHS.

There were 874,623 births registered in the Province during the year 1897, a smaller number than for 1896 by 10,069. The birth-rate per mille of population in 1897 amounted to the three previous years. but higher than the mean birth-rate of the past ten years (1887 to 1896) by 3.3.

Punjab birth-rate higher than that of other Provinces of India.

2. In the subjoined table the birth-rate of the Punjab is contrasted with the rates recorded in other parts of India during the year 1897:—

				Birth-rate per mille.					Birth-rate per mille.
Bengal	•••	***		36.94	Central I	Provinces	•••	•••	26·66 28·7
Assam	•••	•••	•••	32.58	Madras Bombay	•••	•••	•••	33·46
North-W and Ot	estern idh	Provi	nces	31.10	Punjab	•••	•••	***	426

As was the case last year, the Punjab again shows the highest birth-rate when compared with the birth-rates registered in other Provinces of India. This may in part be attributed to the system introduced during the past three years of checking omissions in the chowkidárs' memorandum books through the agency of the Vaccinators and Divisional Inspectors.

- 3. Annual Form No. I indicates the districts which recorded the high
 Districts in which high est and lowest birth-rates: the highest were Jhang 57.5 est and lowest birth-rates: the highest were Jhang 57.5 per 1,000, Gujránwála 53.2, Karnál 49.6, Mooltan 48.5, Ferozepore 47.8, Siálkot 47.8, Amritsar 47.4, Muzaffargarh 47.2, Gurgáon 46.8, Ludhiána 46.6 and Delhi 46.2; the lowest were Simla 19.3, Pesháwar 30.5, Kángra 30.3, Hazára 31.4. In the remaining 16 districts the rates varied between 33.9 and 45.9 per 1,000.
- 4. Compared with the previous year, there was a very considerable Causes of low and high birth-rates in certain districts.

 falling off in the number of births registered in the districts of Hissár, Jhelum and Gujrát, particularly in the first-named district, in which the rate fell from 45.4 in 1896 to 33.9 in 1897; in Jhelum and Gujrát the birth-rates in 1897 were 36.5 and 35.7, or 5.1 and 4.6 less than in the preceding year. The low birth-rates in these three districts appear to have been due to the prevalence of scarcity and the emigration of a large portion of the population to other parts of the Province. In the districts of Jhang and Muzaffargarh, on the contrary, the birth-rates rose in 1897 to 57.5 and 47.2 per 1,000, from 49.8 and 40.3, respectively, in 1896. This increase is, on the other hand, due partly to immigration from famine-stricken districts.
- 5. On reference to the figures noted in the table below, it will be seen Registration in frontier that, as noticed in my last Annual Sanitary Report, there has been of late years a marked improvement in the registration of births in the frontier districts of Kohát, Bannu, Dera Ismail Khan, tration of births in the frontier districts of Kohát, Bannu, Dera Ismail Khan, tration of births in the frontier districts of Kohát, Bannu, Dera Ismail Khan, tration of births in the frontier districts of Kohát, Bannu, Dera Ismail Khan, tration of births and Muzaffargarh, but not so marked in the districts of Hazára and Pesháwar. In Hazára the rate is much lower than it was in 1894 and 1895, and the rate in Pesháwar is only 30.5; but, on the whole, there has been in Pesháwar a steady improvement during the past four years in this

1893:--

respect as compared with the mean birth-rate for the five years ending-

Districts.	Districts. ra per azára sháwar ohát ara Ismail Khan era Gházi Khan	Mean birth- rate for the five-year period ending 1893.	Birth-rate for 1894.	Birth-rate for 1895.	Birth-rate for 1896.	Birth-rate for 1897.
Pesháwar Kohát Bannu Dera Ismail Khan Dera Gházi Klan	•••	27.0 18.0 25.9 27.2 28.8 22.9 30.8	37·1 24·4 40·4 39·6 44·5 34·8 35·4	35·8 29·2 42·0 44·2 42·7 35·7 39·0	33 9 30 0 39·5 39·6 42·0 39·7 40·3	31·4 30·5 41·2 44·1 41·7 40·2 47·2

There is room for considerable improvement in Hazára and Pesháwar, as the birth-rates of these two, when compared with those recorded in some of the neighbouring frontier districts, show that at least one-third of the number of births that actually occur in them are omitted to be registered. I trust, however, that the persevering efforts of the Divisional Inspector and the Vaccinators will result in greater improvement in the next and subsequent years.

The following statement shows the particular rural circles in which the registration of births was most defective in Defective registration in some of the rural circles. 1897:-

			Male birth- rate.	Female birth-rate.	Total birth-	Number of males born to every 100 females born.
Shankargarh Chársadda Swábi Rajjar Nowshera Pesháwar Katlang Mardán	do. do. do. do. do. do. do.	•••	10·1 13·3 13·9 15·7 14·7 13·7 15·2 14·0 8·0 8·0	7·3 97 93 8·3 102 11·4 10·0 122 7·1 6·9	17·4 23·0 23·2 24·0 24·9 25·1 25·2 26·1 15·1 14·9	138 4 136 8 141 0 189 3 143 · 5 120 · 1 152 · 5 114 · 5

In almost all the rural circles in the districts of Pesháwar and Hazára,. the registration of female births is more or less neglected. I have directed the particular attention of the Divisional Inspectors to the extremely imperfect state of registration in these thanas, as well as in those of other districts in which the birth-rate is comparatively very low. From the reports submitted to me weekly by the Divisional Inspectors it would appear that the villagers are not so much to blame for omitting to register births as the chowkidars. These officials, being illiterate, trust usually to their memories, and having many other duties to perform frequently forget to register the births as they occur.

- The proportion of male to female births in the Province was almost precisely the same as in the previous year, i.e., 22.3 and Proportion of male to 20.2, respectively, in 1897 against 22.6 and 20.5 per mille in 1896. For every 100 births of females there were 110.5 male births, the corresponding rate in the previous year being 110.1.
- The highest birth-rates were registered in the following municipal towns:—Dera Ismail Khan 67.4, Jalálpur, in Mooltan district, 66.4, Kunja, in Gujrát district, 60.1, Chúnián, in The high birth-rates in some of the municipal towns. Lahore district, 59.5; Sáhiwál, in Shahpur district, 58.7, Siálkot 56.0, Khairpur and Alipur, in Muzaffargarh district, 54.0 and 53.7, respectively, Edwardesabad 53.8, Khudián, in Lahore district, 52.7, Wazírabad 51.8, Maghiána 51.4, Jhang 50.4, Chiniot 50.3, Talamba, in Mooltan district, 50.1.

- The lowest rates were recorded in Kuláchi in Dera Ismail Khan district 17.8, Abbottabad 19.6, Anandpur, in Hoshiarpur The low birth-rates of district, 20.0, Simla 20.3, Rájanpur, in Dera Gházi Khan some of the municipal towns. district, 20.9, Dalhousie 22.5, Kangra 24.8, Montgomery In all these towns, with one or two exceptiors, the low rate is due to the great preponderance of the male over the female population.
- There was an excess of 236,396 births over deaths registered in 1897, or at the rate of 11.5 per 1,000 of population. Excess of births over The death-rate, however, exceeded the birth-rate in three districts, viz., Hissár (11.4), Dera Ismail Khan (S.5), and Simla (2.6).

In the following districts the excess of births over deaths was considerably above the provincial average: Gujránwála 25:3 per mille, Siálkot 22:9, Jullundur 19.7, Amritsar 19.1, Gurdáspur 19.0, Lahore 18.2, Montgomery 17.1, Jhang 17:1, Ferozepore 16:1, Mooltan 15:0.

DEATHS.

In spite of the prevalence of scarcity during the year, the Province was, with the exception of a few districts, very healthy: Death-rate of the Prothe death-rate being 31.05 as compared with 31.53 in 1896 vince. and 29.29 in 1895.

The death-rates registered from the principal dis-12. from different Deaths eases in 1897, and the two preceding years are shown in the diseases. The most noticeable feature of the margin. 1895. 1896. 1897. year was the marked diminution in the mortality 0 25 0.03 0.03from small-pox which caused 45,084 deaths Cholera 2.19 078 0.41 Small-pox in 1896, and in the year under report only ... 19:08 19:15 20:57 ta 0:76 0:68 0:77 ... 0:33 0:35 0:35 Fevers Dysentery and diarrhœa 16,077. Mean for the Province	34	30	32	47	29	49	28	37	29	32	35	33

It will be seen from the above table that in the districts of Dera Ismail Khan, Hissár, Muzaffargarh, Dera Gházi Khan, Jhang and Bannu the death-rate in 1897 was considerably above the average for the preceding ten years, the increase varying from 11 to 20 per mille; in Siálkot, Gurdáspur, Amritsar, Gujrát, Gujránwála, Delhi, Hoshiárpur, Lahore, Jullundur, Umballa and Montgomery the death-rate in 1897 was from 7 to 18 per 1,000 below the average; and in the remaining 14 districts the ratio was very nearly equal to the average of the ten-year period.

Alteration of Annual Form No. VI.

16. In accordance with the orders of the Government of India all the municipal towns in the Punjab are entered in Annual Form No. VI B, instead of only the 45 principal towns, the total number being 151.

The high and low deathrates of some of the towns. 17. It will be seen on reference to that statement that in 14 towns a death-rate of over 50 per 1,000 was registered, the rates being excessively high in the following:—

							Deat	h-rate per 1,000.
		(H	issár	***		• • •		67.34
TT) B	hiwáni	***		***	•••	56.70

,			_					

The death-rates in the following towns, when compared with the average rate of mortality registered in all municipal towns, were very low; the attention of the district authorities has been drawn to the matter, as it is almost certain that imperfect registration was the chief cause of such low rates:—

Districts.		Towns.					${\it Death-rate.}$

18. With regard to the proportion between the urban and rural death-

Death-rates in urban and rural areas.

		URBAN.	RURAL.
		Death-rate.	Death-rate.
Cholera Small-pox Fevers Dysentery and Diairhea Injuries All other causes	•••	0·13 0·57 18 43 2 52 0 37 12 43	0.02 0 81 20 80 0.58 0 35 8.12

rates, the results are very nearly the same as those obtained in previous years. The figures noted in the margin show a larger death-rate from dysentery and diarrhœa and all other causes in the towns than in the rural circles and a smaller death-rate in the towns under the head of fevers. The rural death-rate from small-pox is, this year, somewhat higher than the urban.

- 19. Of the 638,227 deaths registered from all causes in the Punjab during the year, 326,924 were males and 311,303 females, equal to a death-rate of 29.62 for males and 32.71 for females per 1,000.
- Of age, viz., 223 for males and 228 for females per 1,000 living. This means that very nearly one-fourth of the children died from different diseases in the first year of life. Amongst children aged from one to five years the death-rates registered during the year were 58:42 for males and 66:76 for females. In the specified age-periods between 5 and 40 years the rate varied from 7 to 14 per 1,000 living, the ratio being, as usual, larger amongst the female population. Between 40 and 60 years the death-rate per 1,000 living ranged from 17 to 29, the male ratio preponderating over the female. Amongst old people of the ages of 60 years and upwards, the death-rate was 89:69 for males and 91:74 for females. Amongst infants under one year, in the districts of Jullundur and Amritsar the female death-rate, as usual, largely exceeded the male.
- 21. On reference to Annual Form No. V it will be seen that the deathDeaths according to rates registered amongst the different classes of population were as follows:—Muhammadans 31.24, Hindús 30.78, and Native Christians 17.25 as compared with 30.51, 32.82, and 17.31, respectively, in the previous year.
- 22. There are six districts in which the Native Christian population exceeds 500, and the following table contrasts the Registration to mong death-rates registered in these districts during the last three years:—

				Population		I	eath-ra	tes.
						1895.	1896.	1897.
Siálkot		***	***	9,482	***	11.92	15.82	12.55
Gurdáspur	•••	***	***	2,069	***	20.78	22.23	19.82
Gujránwála	***	***	***	2,246	***	9.80	10.69	9.80
Labore		•••	7	1,254	***	9.57	15 15	19.94
Amritsar	e wind my	***	***	959	***	20.86	34.41	34.41
Delhi	* * *	***		812		35.71	17.24	33.25

The average death-rate amongst all classes of people being 31 per 1,000 it is evident that registration is extremely defective amongst the Native Christians in the first four districts given in the table, particularly in Gujrán-wála and Siálkot. The attention of the district authorities has been often invited to the imperfect state of registration amongst this class of population. But from some cause or another, Native Christians neglect to have the domestic occurrences in their families registered.

- The birth and death returns of Cantonments given in Annual Form No. VI B show no improvement in 1897. The birth-rate Vital statistics of the for the 28 Cantonments, taken as a whole, was 10 and the death-rate 13 per mille. Ráwalpindi and Pesháwar, with a large population, show a birth-rate of 4, Kohát a birth-rate of only 1 per mille; Dera Ismail Khan 2, Mardán 5, Abbottabad 7, Jullundur and Nowshera 8 each. Abbottabad had a death-rate of 6 per mille, Mardán and Ráwalpindi 7, Siálkot, Pesháwar and Dera Ismail Khan 8, Jhelum 9. These rates are ridiculous, but it seems almost impossible to improve matters. The attention of the Cantonment authorities has been drawn for several years to this point, and it would appear that these imperfect results are due, to some extent, to the population of Cantonments being constantly shifting, and also to the male population being in excess of the female.
- The births and deaths registered amongst the European and Eurasian population there were 120 births and 76 deaths registered during the year, a birth-rate of 14.39 and a death-rate of 9.11 per mille against 17.62 and 9.23 in the preceding year. These figures call for no special remarks.

Number of fines inflicted forneglect to register births and deaths in municipal towns. 25. The subjoined table shows the number of persons fined and the amount of fine inflicted for neglect to register births and deaths in municipal towns:—

There are 15I municipal towns in the Punjab, and in 128 of these, not a single person was fined for breach of the municipal bye-laws. In some of the towns the amount of fine imposed was high, the directions of His Honor the Lieutenant-Governor given in paragraph 5 of his Review on the Sanitary Report for 1896, viz., that a small fine of 2 or 3 annas in cases where the offenders are very poor and ignorant would be quite sufficient, having apparently been overlooked.

26. Every possible effort has been made during the year to improve the registration of births and deaths. I have devoted make registration more my attention to this matter for some years past, and I find that there is only one way of achieving accuracy and that is "proper supervision" of the chowkidárs' memo. books of births and deaths. The agencies through which the accuracy of registration is tested, are the Vaccinators, the Tahsíldárs and Náib-Tahsíldárs and Divisional Inspectors.

Result of inspections by Tahsíldárs and Náib. Tahsíldárs.

27. The annexed statement shows the amount of work done by Tahsíldárs and Náib-Tahsíldárs during the year under report:—

Statement-showing the Results of Inspections of Birth and Death Registers by Tahsíldárs and Náib-Tahsíldárs in the Districts of the Punjab during the year 1897.

*In many of the districts this information is not given.

A glance at the above return will show that, although the Tahsíldárs and Náib-Tahsíldárs visited a large number of villages during the year to inspect birth and death registers, their work in this respect was far from satisfactory. For instance, in the districts of Gujrát and Lahore they inspected 1,514 villages, but did not discover a single omission in either birth or death. In the Siálkot district in 979 villages inspected only one

omission (a birth) was detected. Altogether 15,562 villages were visited by this class of officials and 1,725 omissions of births and 1,620 of deaths were discovered; the corresponding figures for 1896 were 15,111 villages inspected and 2,089 omissions of births and 1,202 of deaths discovered. Of the 1,620 omissions of deaths 449 were of female infants, the largest number being recorded in the districts of Bannu, Dera Ismail Khan, Rohtak and Hazára. The number of chowkidárs fined for neglecting to register births and deaths was 488, and the fines inflicted amounted to Rs. 230. The districts in which a large number of chowkidárs were punished were

28. The number of villages visited by the Vaccinators, the number of number of entries checked and the number of births and deaths found omitted from the registers by them in each district of the Punjab is shown in the statement below:—

Norg.-In some districts the vaccinators inspected villages more than once during the year.

The vaccinators thus checked 266,555 entries of male births and 222,788 of female births during the year. They found 5,844 omissions of births of males and 5,271 of females. With regard to omissions of deaths, the entries checked were 156,402 males and 135,093 females, and the numbers omitted to be registered were 1,441 males and 1,371 females. Last year they found 13,326 omissions of births and 3,420 of deaths. Their work, on the whole, is fairly satisfactory.

Number of omissions dissional Inspectors during the year 1897:—

Total	4,746	62,186	57,185	4,948	4,873	41,748	38,515	3,024	3,107	

The number of villages inspected by Divisional Inspectors was 4,746 against 3,242 last year. Out of 62,186 entries of male and 57,185 of female births checked, 4,948 and 4,873 omissions, respectively, were detected. The numbers of death entries checked were 41,748 males and 38,515 females, and the omissions discovered 3,024 males and 3,107 females. These figures compare very favourably with the results of the previous year. I strongly recommend the continuance of these officials in their present posts, for I have no doubt that registration has very greatly-improved since they were first appointed in 1894.

Section. VI.

Chief Diseases.

30. The following statement shows the death-rates registered in the Death-rates from different Province from principal diseases from 1867 to 1897. inclusive:—

^{*} Up to the year 1890 deaths were registered under the general head " Bowel-complaints."

PLAGUE.

Plague appeared in the Province in an epidemic form, for the first 31. time in 1897. In February a Brahmin named Rám Sarn, Particulars of outbreak left Khatkar Kalán, a village of 1,200 inhabitants situated of plague in the Jullundur and Hoshiarpur districts. about two miles east of Banga, in the Nawashahr tahsíl of the Jullundur district, for the purpose of making a pilgrimage to Hardwár. He returned to his village on the 29th April, and it is reported that he stayed one night at Rahon (another village near Nawashahr) on his way back, and that it was here the symptoms of the disease first showed themselves. time he reached his home he was very ill with high fever and delirium, and after a few days' illness he died. The people of the village in this case apparently recognized that he was suffering from some new form of fever, of which they had no previous experience, but it was not reported at the time. Shortly after the death of the first case, a Brahmin woman was attacked (a relative of Rám Sarn) by name Mussammát Málin, who lived near a large well, situated in this part of the village, and subsequently there were a few more cases of severe fever which caused no anxiety to the villagers, as they were ignorant of its nature, and there was no tendency to an epidemic. At the end of July or the beginning of August, however, rats were noticed to be dying in a curious way in some cattle-sheds, belonging to a zamindar, named Hari Ram, situated not far from the well referred to, but beyond noticing the fact it does not seem to have aroused any suspicion whatever in the minds of the villagers, so far as has been ascertained, or if it did, it was certainly kept quite quiet.

In September the Chamárs, who live on the west side of the village, and whose houses adjoin those of the Brahmins living near this well, became affected. The disease then began to spread more rapidly, and by October had taken on the characters of an epidemic, and the villagers now realized that they had an infectious and very fatal form of disease among them. On the 14th October four deaths took place which thoroughly frightened them, and a report was sent to Banga thána, and the Hospital Assistant at the dispensary went at once to the village, and as the result of his investigations he reported the disease as plague. The Civil Surgeon, Jullundur, then went to the village and expressed the same opinion.

On the morning of the 18th October I received a telegram from the District Superintendent of Police to the effect that plague had appeared in Khatkar Kalán, and I immediately instructed the Deputy Sanitary Commissioner to meet me at Jullundur, and together we visited the village on the 21st October when the disease was officially announced as plague A cordon was placed around the village, and the necessary measures were started for dealing with the epidemic, as from the beginning of the month up to this time, so far as could be ascertained, 44 cases and 24 deaths had taken place. During the following week the entire population of the village were turned out into camp, and hutted in suitable grass huts within the village area. The sick were treated in hospital, while their relatives and all who had been near infected persons were accommodated in a special camp (called the segregation camp) within easy reach of the hospital. The remaining population were placed in another camp known as the health camp; the Muhammadans, Hindús and lower castes being all in separate divisions and arranged so that no disputes about mingling of castes should arise.

The disease showed signs of abating directly the people were got out into huts, and the last case occurred in this village on the 4th December, after which date it remained free, the total number of cases being 79 with 45 deaths, including those attacked before my arrival on the 21st October.

The disinfection of the village was begun on the 31st October and completed by the beginning of December, and may be briefly described as consisting of spraying the rooms with disinfectants, removing the furniture, white-washing the walls, and making large openings in the roofs of all the houses to allow sunlight and air to penetrate freely, while in all infected houses the entire roof was removed and the floor dug up to the depth of three inches. On December the 6th, the Rawals, who had not had a case for a month among them, began to return to the village; other castes followed, and all the inhabitants had returned to their houses by the 27th December. The cordon, however, was not removed till the 6th January in order to allow of 10 days observation, after every one had returned to the village, and the medical officer finally examined every person, and then declared the place free of plague. Plague cases were, however, found in other villages, which showed that the disease had spread, as on the 2nd November Jhandher Khurd, a village west of Banga, and about six miles from Khatkar Kalán, was found to It was dealt with in the same manner, and there were here only be affected. 29 cases and 18 deaths altogether, the last case occurring on the 19th December, the total population of this village being 395. On November the 24th plague was discovered in Khán-Khána, a large village containing 2,500 inhabitants, but it is almost certain that it was present in this village some time before it was reported by the village headmen. The villagers at first were not inclined to leave their houses, as they hoped that segregating the sick would be sufficient to check the disease, but a very rapid increase in the number of seizures (96) during the following fortnight caused them to understand their danger, and in the end they asked to be put out into camp. This was done, and by December 6th everyone was out and the village deserted. After the evacuation of the village the disease, as elsewhere, declined, but not so rapidly. as in the other villages, a fact probably due to the firm hold of the place the disease seemed to have obtained, as well as the large number of persons

under treatment, and to the cold weather which made the people huddle together more than they had previously done.

The next place the disease appeared was at a village named Berámpur in the Garhshankar tahsíl of the Hoshiárpur district, about ten miles distant from Khatkar-Kalán, the outbreak In this case the source of infection was distinctly traced to Khatkar Kalán, as a sweeper's wife ran away from the and she subsequently became ill and she escaped from Khatkar before a village, and from the investigations officers detailed for duty in the infected area, there seems reason for thinking that two, or possibly three, villages were infected before it was realized that there was plague in the district.

Up to the close of the year there were altogether four villages in the Jullundur district and one in Hoshiarpur attacked, 274 cases and 155 deaths occurring in the Jullundur villages, and 28 cases with 20 deaths in the Hoshiarpur one. The disease thus spread slowly in this Province, just as it has done in Bombay and elsewhere, and it was only in the month of February after heavy rain had fallen that it made a sudden rise spreading more rapidly to other villages with increase of cases. At the time of writing this report the total number of villages attacked have been, Jullundur (up to the 2nd May) 62, and Hoshiarpur (up to the 30th April) 14; the total cases in the Jullundur district 2,238 and deaths 1,267, and in the Hoshiarpur district total cases 448 and deaths 269. The increasing heat seems to be checking the disease to some extent, but it is impossible to say whether it will cease altogether or merely lie dormant until next cold season, as it did last year.

CHOLERA.

32. It will be seen from the preceding table, that the Province has suffered very little from this disease since 1892. During the year under review only 622 deaths were reported from it. As to the extent of the area affected by cholera, there were only 31 villages in which deaths were reported out of a total of 37,602 villages in the Province. Of the 622 deaths, 538 were registered in the district of Hissar, 61 in Gurgáon, 15 in Ráwalpindi, 6 in Gurdáspur and 2 in Lahore.

In the Hissar district out of the total mortality of 538, there were 67 deaths registered in the town of Hissar, 84 in Bhiwani, 40 in Hansi, and 347 deaths in 23 villages.

The Province was entirely free from cholera up to the 19th of June, when the disease made its appearance in the small village of Decsar in the Bhiwani thana of the Hissar Particulars of the first district. From the Civil Surgeon's report it appears that the first case occurred in the person of a Brahman woman. She had been to the town of Bhiwáni, where cholera broke out a couple of weeks later on. The woman showed symptoms of the disease on the 20th June. She had eaten nothing at Bhiwani and had returned the same day to her village. She and her son died of cholera, while her husband, her daughter and a second son escaped On the second day of the outbreak the disease appeared in eight other families, and on the third day in four more, all in close proximity to each other. The Civil Surgeon, who visited the place at the time of the outbreak, attributes the appearance of the disease to the following circumstances. The water-supply was contaminated by the washing of the village grounds and the neighbouring fields. A couple of days before the outbreak of cholera a slight fall of rain occurred, and the tanks which had previously been dry were supplied scantily with water from the surrounding fields and the village grounds. The water so collected was dangerous owing to filth from the fields and the village grounds having found its way into the tanks. As the existing wells which usually supplied water were brackish, the people resorted to the tanks for water, and those who partook of tank water were affected with There were altogether 16 deaths registered from it.

The disease is reported to have broken out next in the municipal town of Bhiwani, 6 miles from the village of Deosar. Two Muhammadan policemen were first attacked on the 3rd July in a police guardroom and died the following day. They had not been away from the town but the Civil Surgeon states in his report that "the people of Deosar used to pass by the police guard on the way to the town of Bhiwani, so that there was a probable intercourse between the police and the people of Deosar." With regard to the subsequent spread of cholera in the town, the Civil Surgeon says that "the people attacked with the disease lived in close quarters with each other, all within a circle of a few hundred yards' radius." In the opinion of the Civil Surgeon the cause of the outbreak was the contamination of the water supply. After personal inspection of the town, on the occasion of the outbreak, the Civil Surgeon found the public latrines, the private filth receptacles, the homes of the poor, and the vicinity of the wells in a filthy condition, the water in the tanks black, and the smell from one of the wells most overpower-Contamination of water took place from the filthy state of the tanks and from the bathing and washing of clothes at the wells; also the use of the same water-bags for carrying water from the tanks as well as from the wells. Cholera next made its appearance in the village of Sewani in the thána of the same name, causing 87 deaths in a population of 3,717. The first case occurred in the person of a Muhammadan on the 10th July. He with his brother and two neighbours went to Bhiwani, and on his return fell ill with The water of this village, as in many other localities, is liable to contamination. The Civil Surgeon states that the surroundings of the wells are filthy; people bathe and wash their clothing round the mouth of the wells and in the water tanks, and the wells are so constructed that a person may go down and dip his dirty vessel into the water. The tops of the wells are surrounded with bathing platforms and sleeping and resting accommodation. In fact the wells are meant for tradelers; water is drawn from the wells and lodged in the chaubachás; and those people who are disinclined to go down to the bottom of the well or to draw water from above replenished their vessels from the tanks or chaubachás. Mr. Weston, the Civil Surgeon, made personal inquiries into the particulars of the first cases from cholera in 16 towns and villages, and in many of them he traced the origin of the disease to importation from affected centres. In the villages of Gurana and Sewani the disease was most fatal. All possible efforts were made to prevent the spread of the disease by means of disinfecting the wells by permanganate of potassium and other precautionary measures, and the disease did not spread to any extent.

34. In Gurgáon, the 61 deaths registered in this district occurred in Deaths from cholera in the town of Rewári. The first case which took place on remaining districts. the 31st July was in the person of a railway passenger, a sepoy, who had just arrived from Burma. In the Ráwalpindi district 15 deaths were registered in village Kanat Khalil in the police station of Jatli. There were 5 suspicious deaths reported from a village in the Gurdáspur district and 2 sporadic cases in the city of Lahore. In 26 districts no death from cholera was reported during the year.

Cholera map.

35. The usual cholera map is attached to this section of the report.

SMALL-POX.

36. The severe epidemic of small-pox which visited the Province in 1896, and caused 45,084 deaths, diminished during the year under report to 16,077: of this number 3,420 and 2,124, respectively, were registered during the months of January and February—a continuation of the high mortality of 1896. In March and April the number fell to 1,789 and 1,729. In May there was a slight increase, the mortality having risen to 1,909. In the following month the deaths registered were 1,643, and from that month the mortality went on decreasing till October, when 303 deaths were registered. This was practically the end of the epidemic, which at its height, during the month of May 1896, caused 8,047 deaths. The subsidence of the epidemic was

noticed in many districts of the Province, and the returns for November and December did not show any marked recrudescence of the disease, the number of deaths registered from small-pox in these two months having been only 383 and 393.

It will be seen from the following table that in the month of October 1897 the epidemic had entirely subsided in the districts which suffered most

severely from it in 1896 :-

10 II 10 III 100	•					from s	ortality mall-pox 1896.	Mortality registered in October 1897.	
Ferozepore			•••	• • •		•••	4,954	32

37. As usual, the lowest death-rate from small-pox, viz., 0.02, per 1,000 of population, was registered in Kángra, the best vaccinated death-rates from small-pox ed district in the Province. Next to Kángra the smallest rates were recorded in the following districts—

						ber of deaths registered.	Death-rate per 1,000 of population.
${f Rohtak}$		• • •		•••	•••	15	0.03
Gujrát				•••		53	0.07
Gujránwála			•••			7 5	0.11
Delhi		•••	•••	•••		88	0.14
Simla	•••	•••	•••		•••	5	0.14

38. The death-rates for all the municipal towns, 151 in number, are High death-rate from shown in Annual Form No. II for the year 1896 and in Annual Form No. VI (towns) for 1897. It will be seen that in a large number of these towns the death-rate from small-pox was excessive, which indicates clearly that vaccination work is neglected in them. It is hoped that during the next vaccinating season Civil Surgeons will see that all towns with a high death-rate from small-pox are thoroughly vaccinated, and that vaccination work is vigorously carried on in them year after year.

FEVERS.

- 39. The number of deaths registered under the head of fevers was 422,826, giving a death-rate of 20.57 against 19.15 in 1896 and 19.08 in 1895. Of the total fever mortality 213,938 were males and 208,888 females, showing a male death-rate of 19.38 and a female rate of 21.95. As usual the highest death-rates were registered in the months of October, November and December.
- 40. In 19 out of the 31 districts the death-rate from fevers during the The fever death-rate of year was below the average. The decrease was most marked in Gurdáspur, Jullundur, Hoshiárpur, Amritsarand Siálkot. In the districts of Dera Ismail Khan, Muzaffargarh, Hissár, Jhang, Bannu and Dera Gházi Khan the death-rate from fevers was considerably higher than in the previous five years, as will be seen from the following table:—

				Fever death-rate for previous 5 years.	Fever death-rate for 1897.	Increase.
Dera Ismail Khan Muzaffargarh Hissár Jhang Bannu Dera Gházi Khan	***	*** *** *** ***	 	23·47 25·80 22·65 16·14 24·56 23·74	40·49 37·99 34·23 26·56 32·71 31·15	17·02 12 19 11·58 10·42 8·15 7·41

To malarial fevers generally is attributed the cause of the high mortality in these districts.

DYSENTERY AND DIARRHŒA.

41. The total number of deaths registered under the head of "Dysentery Deaths from dysentery and Diarrhœa" was 15,851 against 13,886 in the previous and diarrhœa. year. The death-rate per 1,000 of population for 1897 was 0.77, being slightly lower than the average of the preceding five years.

The districts and towns in which the highest deaths occurred from these causes.

42. In the following districts the death-rate was comparatively high:—

INJURIES.

44. Under the head of injuries are grouped together deaths from suicide, wounding and accidents, snake-bite and killed by wild beasts. The total deaths registered from all these causes was 7,265 against 7,093 in the previous year.

- 45. The number of deaths due to suicide was 180 males and 175 females. The largest number of suicides was recorded as usual in the district of Gurgáon, viz., 17 males and 46 females. In Amritsar also the number was high. In this district 15 males and 18 females committed suicide. In Hoshiárpur, Karnál and Delhi the number was 12, 10 and 11 males, and 15, 14 and 11 females, respectively. As usual, drowning, hanging and poisoning with opium were the modes commonly resorted to by people destroying themselves.
- 46. The total deaths from wounding amounted to 685, i.e., 538 of males and 147 females. The statement given below shows the districts in which the largest number of deaths from wounding were recorded:—

		1				Males.	Females.	Total.
Pesháwar	403	 		•••		108	22	130
Kohát	• • •	 	•••		•••	52	12	64

More than half the total mortality from snake-bite in the Province during the year was registered in the 8 districts given in the above table. In last year's report the marked increase in deaths from snake-bite was noticed in Gujránwála. I regret to observe that the returns for 1897 show a still larger increase from this cause in this district.

Under the head of hydrophobia 129 deaths were recorded; the numbers reported in 1896 and 1895 were 142 and 144, respectively.

50. The number of deaths grouped under the head of "All other causes"

Deaths from "All other was 175,586. An attempt was made to give the details of deaths recorded under this head, but the meagre information furnished by Civil Surgeons was such that it was impossible to do so

Section IX.—Sanitary Works.

51. The following are the most important water-supply and drainage Water-supply and drain-schemes which were either completed, in progress or under consideration during the year in different parts of the Province.

Works completed.—The Pind Dádan Khan water-supply scheme. (2)

Water-supply schemes. The excavation of two storage tanks in connection with the Bhiwáni water-supply project. (3) The extension of the water-supply to the cavalry lines at Kohát; also to the katcheri and Kohát charitable dispensary.

In connection with the Pesháwar city water-supply during the year 21 new standposts were erected and other minor improvements made. A masonry water-cut was made at Edwardesabad (Bannu district) at a cost of Rs. 6,084 and another at the Katcheri Gate Bazár at an outlay of Rs. 600. Both these works are in progress. The Amritsar water-supply project is ready for submission. The experimental borings have been completed. For the Ludhiána water-supply scheme borings are being taken for experimental wells. Rs. 751 were spent on experiments that are being made in connection with the Mooltan water-supply scheme. The estimates for the extension of the Delhi water-supply have been prepared and submitted to the Local Government for sanction. A project to provide a supply of water to the Cantonment of Mián Mír from Lahore is under preparation.

than half of the town of Jhelum was completed during the year. On the Lahore sewage and drainage schemes Rs. 78,214 were spent as below:—(a) City project, Rs 19,275. (b) Anárkali project Rs. 16,110. (c) Mozang outfall, Rs. 42,829. A number of drains were also constructed in the Pesháwar city at a cost of Rs. 17,633. The drainage schemes of Mooltan, Ráwalpindi, Hazro, Delhi, Part II (Chándni Chowk), Balabgarh, Jagráon, Ráikot, Fázilka, Muktsar and Batála are under preparation, while those of Ladwa, Ferozepoie (cantonment and city), are under consideration. The estimate for diverting the town drainage at Abbottabad from a nullah between the town and cantonment has been sanctioned, but this work is held in abeyance for want of funds. In connection with the drainage project (which is under preparation) of Gurdáspur town, four masonry reservoirs for collecting the sewage of the town were made. The sewage is pumped out from these reservoirs and removed in carts to a distance from the town. A tramway project for the improvement of the scavenging and sanitation of the Lahore Municipality is under preparation and will be submitted for approval to the Sanitary Board.

52. The statement showing the aggregate income and expenditure of the Income and expenditure of the municipal towns in the Province for the year 1897 is given as Appendix C. to this report. The income amounted to Rs. 42,03,884, and there was a balance in hand at the beginning of the year of Rs. 10,92,066. The expenditure during the year amounted to Rs. 43,04,421.

53. The amount expended on sanitary works under the chief heads for Comparative statement the years 1895, 1896 and 1897 is given below for comparison:—

							DURING THE YEAR

- 54. The expenditure on drainage, sewerage and water-supply, in-Expenditure on drainage, cluding cleaning of tanks, &c., amounted to Rs. 1,02,847 sewerage, and water-supply. and Rs. 2,17,183, respectively, as compared with Rs. 1,26,608 and Rs. 1,66,744 in the preceding year.
- 55. The income derived from the sale of manure amounted to Income from manure and Rs. 1,49,120 as compared with Rs. 1,36,076 in 1896 and town sweepings. Rs. 1,39,434 in 1895.
 - 56. The following works of public utility were constructed during the year 1896-97 by private individuals at their own expense to serve sanitary purposes:—

In the Delhi district a dharmsúla near Murthal, on the road leading to Memorput Ferry, was constructed at a cost of Rs. 3,000 by Sada Rám, Bohra of Murthal. Moti Lál, Khatri of Naya Bans, Delhi, spent Rs. 2,500 on a masonry well for the use of travellers near Bara Pula on the Delhi-Mathra road. Rohtak district a dharmsála at Patodah, at a cost of Rs. 2,000, was constructed by Nathu Rám and Rámji Dás, sons of Bhura Mal, Mahájan, of Patodah. A dharmsála on the road leading from Riwara to Katwal was constructed by Ramchhore Dás, Bairági of Bhainswal Kalán, at a cost of Rs. 1,500. Brahmin, of Mawi, spent Rs. 1,200 on a dharmsála on the Katwal and Kahni road in the Rohtak district. In Karnál a masonry bathing ghât at the Pundri Tank was constructed at a cost of Rs 5,000 by Pundit Brindabhan, son of Ghási Rám, Brahmin, of Pudri, tahsíl Kaithal. Mussammát Jai Devi, widow of Bálmokand, Mahájan, of Mauza Sewa, tahsíl Pánipat, built a dharmsúla at Sewa, tahsíl Pánipat, at a cost of Rs. 1,660. Digging a tank at Naultha in tahsíl Pánipat at a cost of Rs. 1,500 by Langra Faqírs of Naultha village, tahsíl Pánipat. A masonry building with baradari and one tank on the Kaithal-Pehowa road was built by Lala Sahu Mal, Mahajan, at a cost of Rs. 1,075. In the Umballa district Muhammad Umar, son of Azímullah, of Morinda, tahsíl Rúpar, built a sarai at Morinda at a cost of Rs. 1,235. A dharmsála at Nagla was constructed at a cost of Rs. 1,200 by Nihála, lambardár of Nagla, tahsíl Kharar. In the district of Kángra Mussammát Surjo, widow of Bhagat, Brahmin, of Daroh, tahsíl Pálampur, built a masonry well at Thoral, tahsíl Pálampur, situated on the road to Pálampur, at a cost of Rs. 2,000. In Hoshiarpur district a well near Dehlon on the Santokhgarh-Babhuar road in tabsíl Una was constructed for the use of travellers and the public in general, by Labha, son of Prema, carpenter, of Babhuar, talisil Una, at a cost of Rs. 2,500. A rest-house was constructed at Santokhgarh on the Una-Núrpur road for European travellers and officers on tour at a cost of Rs 3,000 by Milkh Ráj, son of Nihál Chand, Brahmin, of Santokhgarh, tahsíl Una. In Ludbiána Lála Shibdiál, of Máchiwára, built a sarai at Samrála at a cost of Rs. 3,204. In Ferozepore a small masonry tank was constructed by Madan Gopál, resident of Fázilka, at a cost of Rs. 2,500. Rabi Mal, son of Gopi Mal, Nauria, of Dharmkot, spent Rs. 25,000 on a sarai at Dharmkot. In Lahore a masonry well with a house and a temple in village Kamanh, was constructed by Maya Mal, Sáhúkár, of Lahore, at a cost of Rs. 1,200. Lála Kalyán Dás, Contractor, Ráwalpindi, spent Rs. 10,000 on a sarai and well on the Ráwalpindi-Murree road. A tank at Sagri was built by Mehta Wazír Chand pensioned Extra Assistant Commissioner, of Sagri, at a cost of Rs. 5,000. A well and accommodation for travellers on the Grand Trunk road between Wah and Serai Kála, was constructed by Ahmad Khan of Wah, tahsíl Attock, at a cost of Rs. 5,000.

Statement showing statistics of mortality in localities where water-works, drainage, or both, have been carried out.

57. In the following statement is given a comparison of the statistics of mortality in those places where drainage or water-works, or both, have been carried out in the Province:—

Maheshpur	1893				Inform	ation r	not avail	able.				

The year of the completion of the drainage scheme in the case of the town of Ráwalpiudi was, by mistake, shown in previous reports as 1891. The work has not yet been put in hand. As ordered by His Honor the Lieutenant-Governor, in para. 13 of the Review on the Sanitary Report for 1896, I have had a separate statement prepared for the town of Pesháwar; showing the death-rates from principal diseases; first, before the completion of the drainage; secondly, after the completion of the drainage, but before the completion of the water-supply; and, thirdly, after the completion of the water-supply. So far as the figures go there is a decided improvement in the death-rate from cholera in Pesháwar as well as in almost all the other towns and rural circles shown in the above table, but the ratio from fevers has been in certain cases higher. I think a few more years must be allowed to elapse after both drainage and water-works have been introduced in each place, and the use of pipe water become more general; before the statistics can be safely relied on as evidence of improvement.

SECTION X.—General Remarks and Personal Proceedings.

58. I held the office of Sanitary Commissioner, Punjab, throughout the year, except for one month and twenty-four days when I went on privilege leave. During this time Surgeon-Major C. J. Bamber, Civil Surgeon of Ráwalpindi, officiated as Sanitary Commissioner.

The office of Deputy Sanitary Commissioner was held by Surgeon-Captain C. H. James from 1st to 5th January, when he proceeded on three months' privilege leave, and his place was taken by Surgeon-Captain G. Y. C. Hunter.

Surgeon-Captain C. H. James returned and took up the duties of the office on the afternoon of 3rd April, but was again relieved by Dr. Hunter on April 6th when he received orders from the Local Government to proceed to Bombay to study plague. He was away till June 6th, and Dr. Hunter acted as Deputy Sanitary Commissioner till that date. From 7th June till the end of the year Dr. James was in charge. But since 21st October he has been on special duty in connection with in the Jullundur district under the orders of the Inspector-General of Civil Hospitals, Punjab.

Inspection work of Sanitary Commissioner. 59. I visited the following places during the year:—

In January the towns of Bhera, Miáni, Shahpur, Khusháb, Sirsa, Pind Dádan Khan and 16 villages; in February the towns of Ráwalpindi, Hasanabdál, Hazára, Attock, Nowshera, Pesháwar and 8 villages; in March the towns of Jhelum, Lála Músa, Gujrát, Wazírabad and 6 villages; in April the towns of Delhi, Simla and Kálka; in October Jullundur city, Phagwára, and Khátkar Kalán; in November and December, Kasúr, Ferozepore, Ludhiána, Máchiwára Jagráon and 8 villages.

- 60. During a part of October and the whole of November I delivered the usual number of lectures at the Medical College, Lahore.
- 61. Surgeon-Captain C. H. James, Deputy Sanitary Commissioner,

 Inspection work of Deputy Sanitary Commissioner,

 Bultánpur, Murree, Abbottabad, Banga and Gurshankar,

 and 36 villages; and Surgeon-Captain G. Y. C. Hunter,

 officiating Deputy Sanitary Commissioner, Punjab, inspected Pánipat, Rúpar,

 Murree and 20 villages. The Natives States of Mandi, Suket and Bhajji were also visited.
- 62. The following table shows the number of municipal towns and smaller Inspection work of Civil towns and villages inspected by the Civil Surgeons and Surgeons and Assistant Surgeons during the year:—
 Surgeons.

-	Total		134	2,108	14	159	905			

This statement shows that in 1897 the Civil Surgeons inspected 134 towns and 2,108 villages, compared with 191 towns and 1,696 villages in 1896. The Assistant Surgeons inspected 14 towns and 159 villages, compared with 8 towns and 265 villages.

- 63. One death of a girl was reported from the Lawrence Military Asylum, Sickness in the Law. Sanáwar, during the year, in an average strength of rence Military Asylum, 214. The average strength of boys was 266. The average sanáwar. number daily sick amongst boys and girls, respectively, was 2.84 and 2.41 or 1.07 and 1.13 per cent. of strength. The number of total admissions from different diseases was 117 amongst boys and 99 amongst girls, the largest number of admissions being from intermittent and remittent fevers. The want of a proper and abundant water-supply is the great need of this Asylum just now. Dr. Bamber visited the Asylum in September 1897, and submitted a report to Government.
- 64. In the Lawrence Memorial Asylum, Murree, there was no death Sickness and mortality registered during the year. The total strength of the Asylum was 82 males and 76 females. The average number daily sick was 4.00 and 3.70, respectively, showing a percentage of 4.89 for boys and 4.85 for girls. There were 2.23 admissions during the year, the largest numbers being from mumps and measles, viz., 101 and 79, respectively.
- of 3. The following statement shows the birth and death-rates in the vital statistics of selected villages situated on the Western Jumna Canal in the districts of Hissár, Rohtak, Delhi and Karnál since 1893, the year from which the tabulation of special statistics in these areas began:-

66. The following are the districts in which substantial progress was Cleaning and repairing made during the year in the cleaning and repairing of wells:—

The District Board, Siálkot, expended Rs. 996 in cleaning out 216 wells and constructing parapets and platforms of 130 wells, both in villages and on the roadsides in the district. In the district of Gujránwála 708 wells were cleaned out at a cost of Rs. 1,910 by the local bodies of the district, but no special provision was made for platforms and parapets. In the Jhang district the District Board expended Rs. 131-11.7 in cleaning out wells and repairing their platforms and parapets. Rupees 108-9-0 were spent by the District Board, Delhi, in cleaning and repairing of 11 wells. In Gurgáon 2 wells have been sunk by private individuals at Gurgáon and Rewári; 34 drinking wells were cleaned, 2 wells were repaired at a cost of Rs. 85. A sum of Rs. 75 was given out of District Fund towards sinking a pucca well at Umarpur, where the villagers had collected Rs. 123 themselves. In the Karnál district 40 wells were cleaned out in the town of Karnál, but no new wells were provided with platforms or parapets during the year owing to want of funds. In the Gurdáspur district 54 wells were cleaned and parapets of 17 wells were constructed, and the masonry of 3 wells repaired. In the Gujrát district 60 drinking wells were cleaned out, but no wells were provided with platforms and parapets. Fifteen drinking wells were cleaned out in the Montgomery district, and there are two drinking wells for which provisions of platforms and parapets were made during 1897. Ferozepore district only 3 wells were cleaned and repaired by the District

Board at a cost of Rs. 150-10-9 during the year under report. The District Board, Ráwalpindi, spent a total sum of Rs. 2,145 on improving wells and other sources of water-supply. In Pesháwar a sum of Rs. 13,021 was expended on maintaining works, repairs to Bára band and to wells. In the Jhelum district all municipal wells were cleaned out during the year. In the Kohát district the matter of village sanitation and improvements to drinking water wells and tanks received some consideration from the District Board, and wells and other sources of drinking water were improved at an aggregate cost of Rs. 254 during the year. In the Muzaffargarh district 46 wells have been cleaned during the year. The construction of platforms round the wells in the town of Dera Ismáil Khan is in progress. In the Bannu district 3 wells on the encamping grounds at Domel, Nauring and Miánwáli, and the wells in the Isa Khel parganah were cleaned by villagers, and kacha parapets were supplied to some of them. The number of wells cleaned in the Amritsar district during the year was six. The remarks made in the annual reports received from the other Deputy Commissioners is to the effect that several wells were cleaned in the districts and several parapets provided.

67. The Civil Surgeons of Shahpur, Gujránwála, Gurdáspur and Gujrát Gratuitous distribution have mentioned in their reports that the system of the of quinine. gratuitous distribution of quinine is popular and appreciated by the people. Lála Múl Chand, the officiating Civil Surgeon of Karnál, however, is not of this opinion. He says:—

Rupees 90 were spent in purchasing quinine for free distribution in the district through zaildárs and lambardárs, &c. A greater part of this may have gone for the use of the influential and well-to-do people in the district. Personally I see there is no necessity for free distribution any longer, as the people have now become fully alive as to the benefits of the prophylactic; and its purchase through the post office and other agencies will be enhanced if the gratis distribution be put a stop to. Of course, the gratis distribution through the district dispensaries should be continued as heretofore.

Surgeon-Captain D. H. Graves, the Civil Surgeon of Dera Gházi Khan district, states that vaccinators were supplied with medicines for distribution in the district. They attended 2,986 cases. They do a considerable amount of good in distributing simple medicines. A special sum of Rs. 60 is sanctioned by the Deputy Commissioner of the district for purchase of medicines for vaccinators, and also a fairly large sum for the distribution of quinine to headmen of villages, lambardárs and zaildárs. This year quinine was freely distributed in the district, and about 3,000 people were supplied with quinine by the headmen of villagers.

- Sewage farm. Committee of Delhi, it appears that the system is working well. He says:—"The filth trenching farm in Mauza Khandrát Kalán is a success so far, for it takes the filth of most part of the city without causing any nuisance, and the canal just made is working well and giving satisfaction. It is hoped that the canal water-supply now secured will in a few years transform this waste land into fine fields, yielding a considerable revenue, and above all be the means of using up all the filth of the city as manure instead of its being frittered and constituting a dangerously increasing nuisance year after year."
- 69. From the Annual Sanitary Reports received in this office from the Khillats and rewards to Deputy Commissioners, it appears that no remission of revillagers for sanitation. Venue or reward or khillats were granted to the headmen of villages or villagers for interest displayed in the sanitary improvements of their villages.
- 70. One hundred copies of the village sanitary inspection books were village sanitary inspection books were supplied to the Deputy Commissioners during 1897. These books (which have been kept in several villages in every tabsil of the district) have proved useful in giving important sanitary information to the inspecting officers at the time of their visits to the villages.

Sanitary Board.

- 71. Only one meeting of the Sanitary Board was held during the year at Simla. The following subjects were considered and discussed by the Board:—
 - (1) Papers regarding the excessive death-rates from fevers in the Province, also the Note by the Secretary, Sanitary Board, submitting a statement showing the thánás which are considered dry and those which are considered wet from nine districts in the Province, also Punjab Government letter No. 977, dated 1st June 1897, directing that certain information for the years 1890-96 should be obtained and tabulated for each circle of the tahsíls of Pathánkot, Shakargarh, Palwal, Rewári, Tarn Táran and Kasúr.
 - (2) Papers relating to the unhealthiness of the villages in the Neli circle tract of the Kalsia State, and also of the villages in the Neli circle tract of the Kharar tahsíl or British territory; also Secretary, Sanitary Board's Note, together with the vital statistical returns of these two groups of villages for the year 1896; also Dr. Dyson's report and suggestions for improving the health of the people residing in these villages.

With regard to No. (1), the Board resolved that when the statement now required by Government is tabulated, the information laid before the Board this day regarding the wet and dry thánás of these nine districts, be added as a supplement to that statement.

With regard to No. (2), the Board, having carefully perused Dr. Dyson's interesting report, considered that his suggestion regarding the regulating the share of water to which the cultivators of the Patiála and Kalsia State are entitled by agreement was impracticable, but recommended that his suggestion for the free distribution of quinine all the year round, and not only during the rains, be carried out.

The Board also resolved that copies of all correspondence on the subject up to date be forwarded to Government for the information of the Financial Commissioner, and the mortuary returns of these villages be continued to be sent for a series of years to the Sanitary Commissioner for tabulation.

The following miscellaneous papers were circulated amongst the members of the Board and ordered to be recorded:—(1) Minutes of the 1st Meeting of the North-Western Provinces and Oudh Sanitary Board held at Lucknow on 23rd November 1896. (2) Punjab Government Circular No. 22, dated 22nd February 1897, together with a set of rules to be observed in the management of the more important fairs in the Punjab. (3) Papers regarding matters connected with the sun eclipse and other large fairs at Thánesar. (4) Papers and a plan of the drainage project for the town of Ferozepore. (5) Report by the Sanitary Commissioner, Punjab, on the sanitary condition of Lahore. (6) Proceedings of the 23rd Meeting of the Sanitary Board, Bengal, dated 15th March 1897. (7) Minutes of the 2nd Meeting of the North-Western Provinces and Oudh, held at Lucknow on 11th January 1897. (8) Punjab Government Proceedings No. 373—6, Part A, for March 1897, regarding the suppression of the Bari Shah Latíf Fair, known as the Núrpur Fair, in the Ráwalpindi District. (9) Succinct report of the Sanitary Board, North-Western Provinces and Oudh, for 1896. (10) Proceedings of the 24th Meeting of the Sanitary Board, Bengal, held on 27th August 1897.

W. A. CRAWFORD ROE, F.B.C.S., D.PH., CAMB.,

BRIGADE-SURGEON-LIEUTENANT-COLONEL,

Sanitary Commissioner, Punjab.

[
23	24	25	26	27	28	29	30	31	32	33
			Rs.	Rs.						
32.0	32*3	32-1	2,493 -	19,395	Dramage defective in tract of the country on the canal hank and bested the Ghaggar in the Sirsa tahed. Only in the Hánsi tahed of this district is there any waterlogging.	10 to 140	Water in the wells is far from the surface and difficult to draw and sheer necessity drives people to use water from the tanks for drinking pur- poses, which is filthy.	There is not much dome-tic cleansing or conservancy in villages in this district. Fortunately the want of conservancy is not so injurious in a dry district as it would be in places where the nainful is considerable.	A scheme is under prepalation by the Irrigation Branch, Public Works Depart- ment, to remove obstructions to drainage, &c.	
31.1	30-3	80.8	384	7,507	The drainage in this district is good, but there are a few water logged tracts.	20 to 1 20	Water generally salt- ish or brackish, most ly during rainy sea- son.	Domestic cleansing and conservancy not good even in well-to-do houses and bad in the houses of poor. Drainage and conservancy system not efficient.	Measures are being taken gradually to remedy the defects in the water-logged areas.	
33.2	32*4	32*9	329	9,902	The only obstruction to drainage m this district occurs near Palwal (by the Agra Canal).	Information not avail- able.	Water chiefly brackish	No proper conservancy in houses	Remedial measures regarding the ob- struction to drainage are under considera- tion.	
37*9	40.1	38•9	5,736	98,011	All obstructions formerly caused by the Western Jumna Canal have been removed and very little re- mains to be done in this district.	11 to 70	None	Conservancy arrangements with regard to removal of filth not good.	All the drainage lmes in this dis- trict have been cleared by the Public Works De partment, Irriga- tion Branch.	e
39-1	41.7	40*3	335	12,049 -	There are some obstructions to drainage in many parts of the district.	10 to 140	Well water obtainable but not good, and somewhat brackish.	Main drains cannot be flushed and are very unsatisfactory in consequence.	Regarding the ob- struction to drainage reme thal measures are under contemp lation in the Pub- lic Works Depart ment, Irrigation Branch.	o.e.
41.3	43.5	42.3	355	10,706	Liable to floods in places	6 to 52	Well water liable to contamination.	No village conservancy		
24-2	28.0	25*6	117	33,285	In this district drainage is not obstructed in any way.	Information not available.	None	No village conservancy		
33.8	34.7	34.3		3,717	In this mountainous district the natural drainage is perfect.	Information not available.	Water obtained from wells and baolis, and for the most part liable to pollution.	Domestic cleansing not good among the lower classes. Conservancy arrangements not satisfactory.	Attention has been paid to the village sanitation.	en ge
35*6	36•4	36-8	1,875	10,910	In this district there are several hill torrents which overflow during the rains, and cause an overflow in certain portions of the district. This has formed the subject of much correspondence in this department, but no feasible arrangements have yet been made to remedy these ovils.		Several of the wells are not protected with suitable copings.	t Village conservancy improving	The District Authorities devot much attentio to the matte whenever an area is excessive ly flowed.	n er
35.4	41*9	38-	2,50	16,45	Country lowlying and inundated during rains in many parts.	9 to 22	Wells unprotected .	towns or large villages, no system	4	
			1					force; all the villages are ex tremely dirty in and filthy outsid as a rule no latrines exist in th villages; people go out for call of nature in the fields.	e	
34.0	40*8	37*	1 5,70	14,83	5 The only water-logged tract in thi district is that in the neighbour hood of Máchiwára in the Samrál tahsil. This is due not to interception of drainage but to peroc lation from the main line of the Sirhind Canal.	8. ?- >-	Water obtained from wells brackush and parapets defective.		Every effort he been made by a concerned tremedy the error of water loggis and Rs. 40.0 were spent on drainage scher in connection with it.	all t c vil ng 000
			1		,	*				
31.3	88*1		4 4,6	48 9,3	26 The drainage of this district is, o the whole, satisfactory.	n 12 to 150	Wells and tanks i many cases liable t pollution.	Primitive	Rs. 150 were spe by the Distr Board in clear ing and repair wells.	ic an in

Males.	Fomalos.	Total.	Net receipt of each conservancy.	Net expenditure in c conservancy.	In drainage,	The average dis- tance of the sub- sui water from the surface of the ground (16ct),	In water-supply.	In demestic cleansing and con- servancy.	Measures taken for sanitary improve- ment of district,
23	24	25	26	27	28	29	30	31	32
			Rs.	Rs.					
33.7	35-0	34.3	6,053	28,800	There are no areas or tracts of land in this district subject to overflow- ing or swampage, but the land near the river is subject to floods.	12 to 58	None	No conservancy rules are observed in villages.	******
30*9	31.0	31.0	3,380	9,202	There are two tracts in this district in which the water accumulates in the rainy senson, and the tracts are rendered unhealthy.	14 to 150	Wells more or less are liable to pollution, and in many in- stances brackish.	There is not much domestic cleansing or conservency in villages in this district; fortunately in ordinary years when the rainfall is scarny the want of conservency is not so injurious in a dry district as it would be in places where the rainfall is excessive. Shorkot and Ahmadpur are the only villages provided with drains, but at the latter village the land is subject to floods in the rainy season.	for these tract are under con- sideration.
31.8	32.3	32.0	320	3,365	Natural drainage in this district	25 to 78	Nit	Little attention is paid to domestic cleansing and conservancy.	Fifteen drinkin wells were clean ed out during th year.
35.4	37.8	36.2	10,909	77,578	There are only one or two places in this district which are swampy, otherwise the drainage is natural. Drainage is still very imperfect.	14 to 34	Most of the wells require copings.	Heaps of manure are found in and around the rillages, and the clean-liness is quite unsatisfactory.	Measures are bein taken to improv the sanitary cor dition of thes places that ar
89*4	44.2	41.7	47,355	76,134	Several portions of the district are subject to water-logging.	7 to 34	Water obtained from wells which are liable to surface contamination.		Subject to swamp age. The District Board of Amritsar an Gurdéspur hav prepared
40.0	43.0	41:3	12,400	17,259	There is a good deal of water-logging in this district due to the natural configuration of the country and the heavy rainfall supplemented in places by percolation from the Bari Doab Canal.	9 to 42	None	No conservancy arrangements	scheme for cana- ising and drain ing the Kira- nullah and fo improving the drainage generally.
37*9	38*5	38.2	18,163	19,584	Some portions of this district are subject to swampage.	5 to 40	None	The ground and fields around the vil- lages are made use of by the people for purpose of nature, but the people are required to go to some distance from the villages, with streets and lunes in villages, with the exception of a few in the gardes or large villages, are un- payed.	time to time he the District Atthorities to rect fy matters du
7.9	27-6	27*7	1,768	5,719	No portion of this district is subject to low drainage or overflooding.	7 to 55	Water of some of the wells brackish.		Several drinkin wells were clea- ed out.
38.8	35*9	34*8	8,520	17,152	No water-logged tracts in this district.	25 to 65		Heaps of dung, nightsoil and all sorts of filth are allowed to be thrown in and around villages.	About 708 well were cleaned our
81.3	80-2	30.8	2,080	7,003	A great part liable to flooding	8 to 66	Wells not cleaned and unprotected,	No conservancy arrangements in force.	
32-2	32*6	32*4	567	8,001	Drainage good in this district	20 to 39	Well mouths not sufficiently protected.	Villages contain the average amount of dirt and sewerage. No special measures have been taken or are advisable.	A few wells wer repaired.
3512	35*2	35-2	1,717	42,298	Some portions of this district are subject occasionally to slight over-flooding. No steps seem necessary to prevent it, as the temporary julications formed seem to store water where it is much needed for cattle.	10 to 40	None	Inhabitants remove the refuse to their fields where it is allowed to accumulate until fit for manure, when it is used as such. People attend calls of nature in adjoining lands. The internal conservancy of village sites is generally fair, but nothing is done to keep surroundings clean.	The District Boar spent a total aun of Rs. 2,145 or improving wells and other source of water-supply in the district.
